

## EXTENSION CHALLENGES

The previous challenges throughout this course are within their respective sections. As a result, it is fairly intuitive to know which functions or procedures to employ when solving a problem.

The extension challenges are here to provide you with an opportunity to extend your understanding and solidify your coding ability.

Since these extension challenges do not fall within a specific lecture category you will need to think about which functions and procedures to use.

Some challenges will require multiple stages of coding e.g. have conditional IF statements within loops and using multiple PHP functions. Other challenges may be quick and easy for you to complete.

It would be great to see you post your unique solutions in the discussion area and to ask questions of other students if you get stuck, thus providing an opportunity for other students to try to help. This is a great way to learn!

Enjoy the challenges!
