

PICK A CARD, ANY CARD

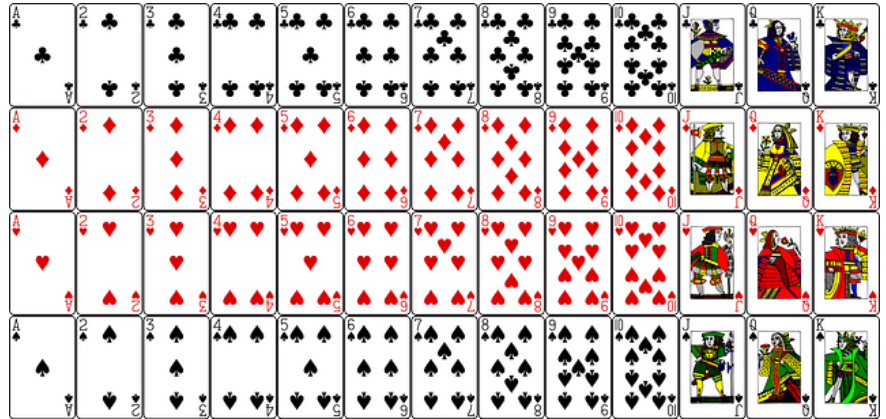

This task is based on using arrays and selecting random elements from arrays.

In a pack of playing cards there are 4 suits:

- clubs
- diamonds
- hearts
- spades

There are 13 cards in each suit:

- Ace
- 2
- 3
- 4
- 5
- 6
- 7
- 8
- 9
- 10
- Jack
- Queen
- King

Your task is to create two arrays, one for the suits and one for the values.

You then need to select a random element from each array which will then represent a playing card.

For example, if a **spade** was randomly selected from the suits array and a **5** from the values array then the playing card would be the **5 of Spades**.

You simply need to output the playing card to the user.

E.g. The randomly selected card is the 5 of spades.
